THE ECONOMIC IMPACT OF CROP INSURANCE ON MISSOURI COUNTIES

BY KEVIN MOORE
EXTENSION AGRICULTURAL ECONOMIST
UNIVERSITY OF MISSOURI-COLUMBIA MP 626

THE ECONOMIC IMPACT OF CROP INSURANCE ON MISSOURI COUNTIES

Kevin C. Moore¹

Introduction

Farmers face risks of adverse events such as excess moisture, drought, frost and hail which reduce crop yields, sometimes to catastrophically low levels. Similarly, for some crops the risk of quality damage and resultant reduction in sale price/unit is significant. These adverse events are, for the most part, **outside their control**. To provide financial protection, farmers often use crop insurance as a component of their risk management plan.

Crop insurance offers the opportunity to substitute a known cost, in the form of an annual premium, for an unpredictable yield and/or quality losses. Crop insurance can provide a foundation under cash flow budget and end-of-year balance sheet projections because the farmer receives an indemnity payment if a yield reduction in excess of their deductible occurs.

In the current economic situation, lenders often look more favorably upon loan requests from producers who have outlined prudent risk management plans. Further, cash flow stability may provide the liquidity necessary to remain in business if a significant crop loss occurs.

Multiple-peril crop insurance can be used to reduce the risk of using forward pricing to market crops. If a low yield occurs as a result of an adverse event(s) outside of the control of the farmer, the crop insurance indemnity payment typically can be used to purchase a crop to fill the contract requirements.

Risk Exposure in Missouri

Missouri farmers are exposed to substantial production risk, as shown in Figures 1 and 2. Figure 1 shows the distribution of the major causes of loss from 1981 to 1986, based upon multiple peril crop insurance (MPCI) claims. Figure 2 shows the premium paid by farmers vs. the indemnities paid to farmers by the insurance industry.

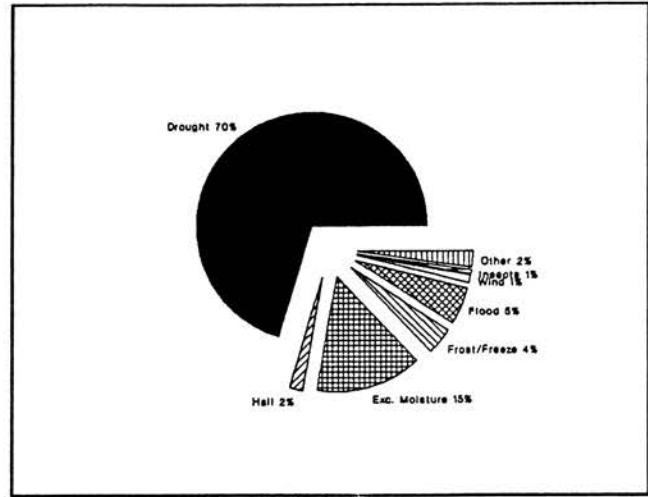

Figure 1. Why Crops Failed 1981-86²
Drought stands out as the major crop risk in Figures 1 and 2. The 1984 drought resulted in losses paid totaling over four and one-half times the amount of farmers premiums.

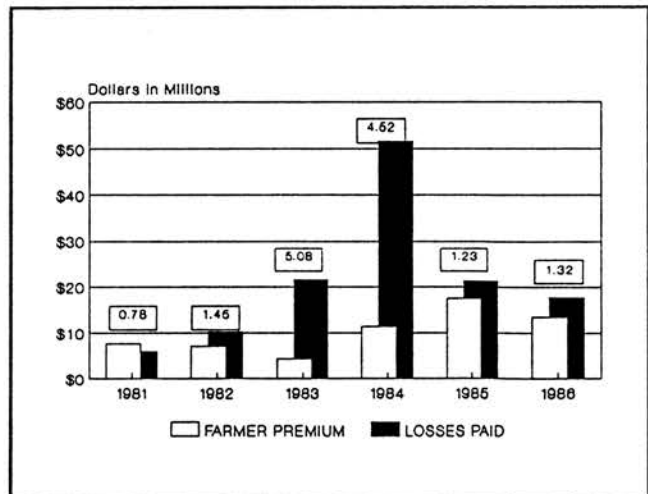

Figure 2. Multiple-Peril Crop Insurance Premiums Paid and Indemnities Received by Missouri Farmers, 1981-86
(The values in the boxes above the bars for each year are the ratio of MPCI indemnity payments paid by the insurance industry to farmers (benefits) to premiums paid by farmers)

Community Impacts

One of the potential benefits of crop insurance to an individual farmer is to provide the financial liquidity needed for the operation to stay in business in the event of a significant crop yield reduction. As a risk management tool, crop insurance **stabilizes farm cash flow.**

Crop insurance can have the same impact on the economy of the whole community. Indemnity payments, net of premiums paid by farmers, help stabilize farm income and in turn provide stability in the local community. The net difference between indemnity and premiums provides a stimulus to the economy and reduces the negative the impact of reduced crop sales due to crop losses.

Farm financial problems and farm liquidations create economic stress in the whole community. Risk management techniques such as crop insurance which help stabilize farm income have a similar stabilizing impact on the economic base of the community.

Basic Types of Crop Insurance

The two kinds of crop insurance available to Missouri farmers are:

1. Multiple peril crop insurance (MPCI) which is designed to provide catastrophic protection against yield losses from most unavoidable causes of loss. MPCI covers most natural perils such as those shown in Figure 1.

2. Commercial hail/fire crop insurance (H/FCI) which provides protection (from hail and fire only) up to the actual cash value of the crop.

MPCI guarantees a minimum average yield per acre for the insured crop with the guarantee based upon the farmer's actual production history (APH), with the guarantee based on the deductible chosen. The deductible levels are 25, 35 and 50% of an estimate of the 10 year average yield. For most crops, the 35% deductible covers variable costs. The 50% deductible covers a similar proportion of costs to that provided by the USDA's disaster program that was replaced by the expanded MPCI program in 1980.

Hail/Fire Crop Insurance (H/FCI) is available on most crops through a variety of coverage plans. Most plans provide coverage up to the actual cash value of the crop. A variety of deductibles are also available that directly affect the premium cost of the coverage.

MPCI coverage must be purchased prior to planting, typically by September 30, for fall planted crops and April 15, for spring planted crops. H/FCI coverage can usually be purchased anytime up to the time the crop is harvested. There is usually a 24 to 48 hour waiting period between the time of application and when coverage goes into effect.

MPCI and H/FCI coverage can be combined on the same crop. This provides a full range of coverage against most perils, and up to the actual cash value of the crop for the hail and fire perils. Both forms of crop insurance are sold by local insurance agents.

Changes in MPCI Since 1980

The Crop Insurance Act of 1980 initiated a series of significant changes in the multiple peril crop insurance program. One of the objectives of the act was to make crop insurance available to the growers of all major crops. Coverage is now offered on all ASCS program crops and most other commercial crops. The crops covered in Missouri are shown by county in Table 1.

Another objective of the act was to provide crop insurance as a replacement for the USDA disaster program. The 1985 Farm Bill added an additional provision. **Beginning in 1987** farmers were not eligible for emergency low-interest loans if multiple peril crop insurance was available to them and they did not purchase it.

One of the most significant changes in MPCI has been the introduction of **individualized coverage.** The farmer's insurance yield is based on the **farmer's actual production history (APH).** This replaces the county average yield concept used previously to set the coverage levels for individual farmers.

The MPCI premium rate per dollar protection varies with the farmer's average yield. The higher

the farmer's average historical yield, the lower the premium rate.

MPCI Participation

Farmers in Missouri have responded to changes in the program by increasing their use of MPCI in their risk management plans.

The area covered in Missouri by MPCI since 1981 is shown below:

1981	954,000 acres
1982	966,000 acres
1983 (PIK year)	612,000 acres
1984	1,690,000 acres
1985	2,777,000 acres
1986	2,648,000 acres

The history of crop insurance in **your county** is shown in the tables that follow. These tables show the protection in force, the acres insured, premiums

and losses paid for both MPCI and H/FCI for each year since 1981. The "benefit-cost" ratios are calculated by dividing the losses paid to farmers by the premiums paid.

The federal government covers the administrative cost of providing MPCI and subsidizes the premium for MPCI. These two subsidies reduce the premium rates paid by farmers by about 50%. The calculated benefit-cost ratios consider only the actual premiums paid by farmers.

For More Information

For more information on the details of MPCI, including an analysis of crop insurance purchase decisions see:

Kevin C. Moore, [A Farmers Guide to Multiple Peril Crop Insurance](#), Missouri Cooperative Extension Service, Agricultural Economics Department, 1988.

¹ Kevin C. Moore is an Extension Economist - Farm Management at the University of Missouri - Columbia. This publication is adapted from publications prepared by H. Doug Jose, University of Nebraska, and Fred Benson, University of Kentucky, and from information provided by the American Association of Crop Insurers, Washington, DC.

² Flood damage is defined by the Federal Crop Insurance Corporation/USDA and the Crop Hail Insurance Actuarial Association as damage that results from water "backing up" on a crop. Excess moisture includes damages caused by water that could not "get off" fields.
