# Challenges and Achievements : Food Sensors

Sheila Grant, PhD  
Dept of Biological Engineering

# Contamination – Radiation

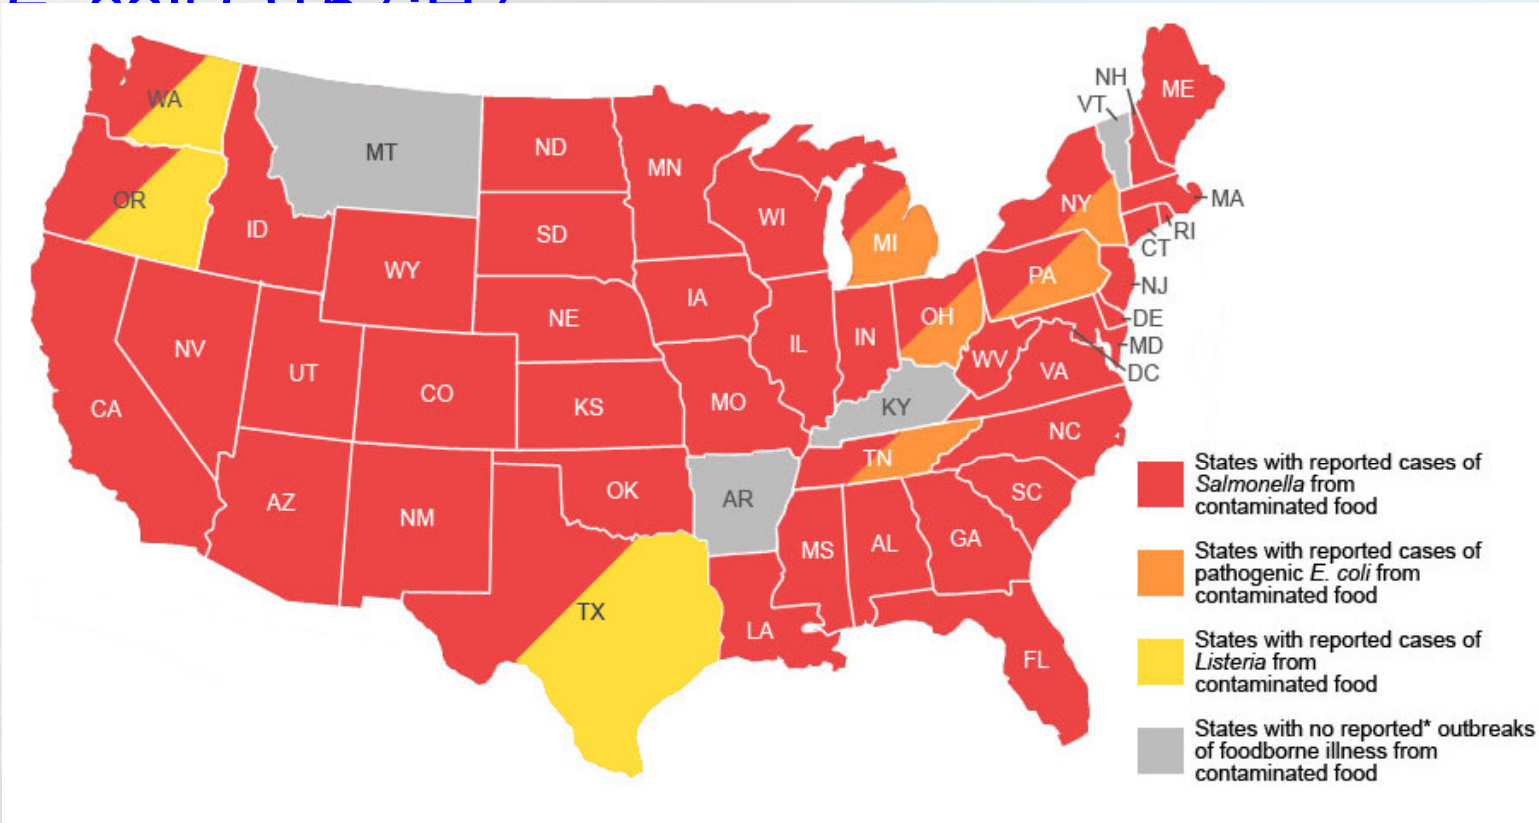

- Radiation
  - Radioactive particles (iodine 131 and cesium 137)

# Contamination – Foodborne Pathogens

*E. coli* O157:H7

Each year in the US, 76 million people suffer foodborne illnesses with over 5000 deaths;  
Yearly costs are estimated to be 5 to 6 billion dollars

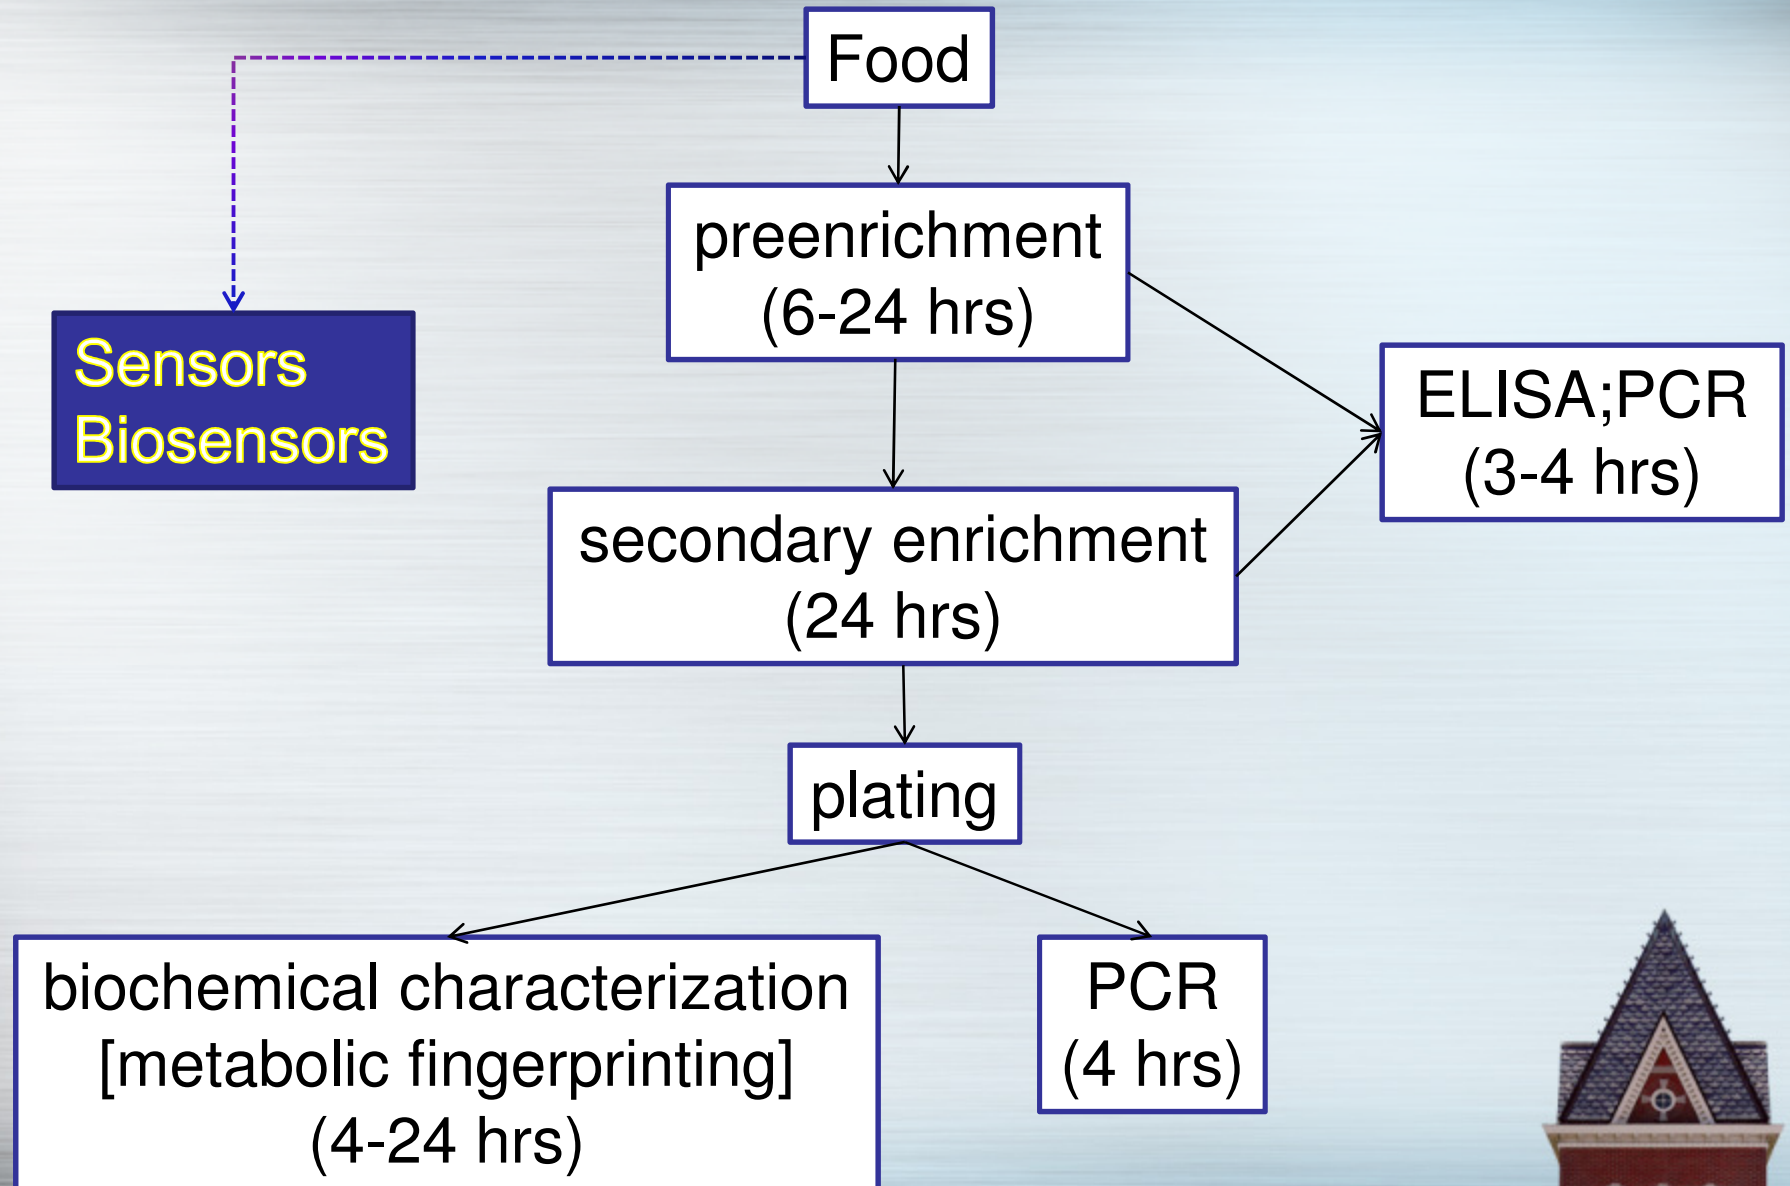

# Challenges – Tracking the Source

Raw food – contaminated during slaughter, growing, harvest  
Processing; Transportation; Storage; Final Preparation

# Ideal Sensor for Food Pathogen Detection

- Fast response
- Accurate identification of toxin
- Low limit of detection
- No false negatives/false positives
- Inexpensive
- Easy to use
- Multi-Analyte
- Disposal/reusable

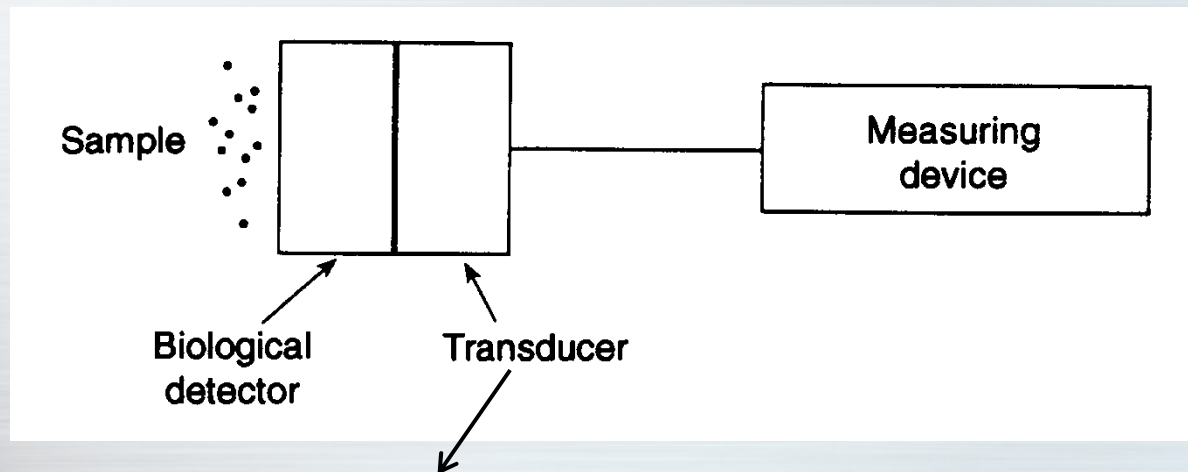

# Sensor/Detectors

- A device that converts signals of one type of quantity into an equivalent signal of another type of quantity.

## Biosensor

- Utilizes a biological agent as the sensor

Electrochemical - potentiometric, voltammetric (amperometric) conductometric, FET-based

Piezo-electric

Optical – fluorescence, reflectance, absorption

SPR, etc.

# Technology Strength: Nanotechnology

- Sensing Mechanism
  - Nanomaterials
    - Metallic nanoparticles (Au, Ag)
    - Metallic nanorods
    - Carbon nanotubes
    - Quantum dots
- Sensing Platforms
  - Nanofibers
  - Nanoporous substrates
  - Nano-cantilevers
  - Cell-based sensors
- Sensor Packaging
  - microfluidics

# Nanowire Sensor Substrates

## Advantages

- High surface to volume ratios
- Enhanced sensitivity
- Rapid detection
- Low power demands
- Miniaturization of sensor systems

# Summary of Nanobiosensor Techniques

Sensing Technique	Analyte Type	Limit of Detection	Reference
QD/Nanoparticles	Oligonucleotides	$\sim 2$ zM	Yeh et al. (2006a)
LSPR	Tau protein in CSF	10 pg/ml	Vestergaard et al. (2008)
Nanowire	Streptavidin	$\sim 70$ aM	Stern et al. (2007a)
Cantilever	1,1-difluoroethane gas	$< 1$ attogram	Li et al. (2007)
Nanopore Cell-based	ssDNA Variety of toxins, pathogens	DNA sequences
