This dissertation analyzes the relationship between oil price shocks and stock market behavior for the US and 13 European countries with monthly data from 1986.1 – 2005.12. Three countries (Denmark, Norway, and the UK) among 13 European countries are oil exporting countries.

With regard to the impact of oil price shocks on the stock market, in most oil importing countries oil price shocks have significantly negative effects on real stock returns in the same month or in one month, while among oil exporting countries only Norway shows a significantly positive response of real stock returns to oil price shocks.

Comparing the impacts of oil price shocks and interest rate (monetary) shocks on the stock market, in most oil importing countries oil price shocks have a greater impact than interest rate shocks, except for a few countries where monetary policy responds systemically to oil price shocks by raising interest rates, which leads to a decline in real stock returns. On the contrary, in oil exporting countries oil price shocks have a smaller impact on the stock market than interest rate shocks, and monetary policy does not respond to the oil price shocks.

With regard to the asymmetric effect of oil price shocks, in the sub-sample period (1996.5-2005.12) when oil price increases more frequently than oil price decreases and the average magnitude of oil price increases is smaller than that of oil price decreases, stock markets in most countries are more influenced by oil price decreases than oil price increases. In particular, statistically significant evidence at the 5% level is found that oil price decreases have a greater impact on real stock returns than oil price increases after the mid 1990’s in the US.
